

Industrial air pollution control training

EcopureTEC

Dürr Services is here to serve you

Technologies · Systems · Solutions

Production reliability and energy management

You need extensive knowledge to be able to optimize the use of an air pollution control system and thus ensure the abatement quality required, maximum efficiency and productivity. Such knowledge can be acquired through the training programs provided by **EcopureTec**, the Training and Education Center of Dürr Systems GmbH, Environmental and Energy Systems. 

Training customized to suit your needs

EcopureTec's training programs are perfectly tailored to suit user requirements, and special requests.

- In our **product training courses** you will learn all about possible applications, design and function of our RTO, TAR and VAR products. Our training enables you to put your equipment to best use, avoid mistakes when running it, detect and correct faults together with our service staff. In addition we inform you of recent process equipment developments.
- Our **basic training courses** will, against the backdrop of the relevant standards and regulations, teach you everything you need to know about recent requirements for air pollution control technology, covering electrical, instrumentation and control equipment as well as centralized supervisory controls. We also

provide information on the full range of energy management solutions using thermal oil, hot water or steam. More detailed knowledge about operation, maintenance, fault detection and correction will be provided in a hands-on approach for the product group in question.

- Our **specialized training courses** are tailored to cover the subjects identified by you, the customer, such as special process equipment solutions, safe handling of noxious emissions, VOC directive, explosion proofing, maintenance, fault correction, optimization of energy consumption, etc.

Designed to maximize learning success

A perfect interplay of methodology, theory and practice, with group sizes limited to between ten and twenty, ensuring you get the most out of the training.

The **methodological part**, including the whole process of planning, carrying out training and preparing training materials, is in the hands of experienced, professional trainers.

The **theoretical part** is provided by Dürr EES process and sales engineers who know air pollution control systems including recent developments and the specific requirements of different industries.

The **practical part** will be carried out by experienced service experts and development engineers in a hands-on approach or by simulation models. They know each and every system inside out and can provide practical tips and "tricks of the trade".

The training is targeted towards plant operators, maintenance, safety and quality assurance personnel.

All training courses can also be carried out on your site.

Our training program, contents and schedule can be viewed on the web at www.durr.com/ees-training.

Dürr Services is here to serve you

Knowledge pays off

Training your staff well pays off, as this allows you to achieve an efficient and effective production process by

- optimizing operational safety at high efficiency
- increasing the speed of fault detection and correction
- decreasing the cost of operation
- increasing your plant's uptime reliability

The sooner you benefit from the above action, the sooner this translates into cash savings. So why don't you talk with us about your training needs today.
